# Replacing the spindle belt

**Important notes:**

- Unordered List ItemSince the belt between the spindle motor and the spindle is a timing belt, it is not necessary to tension the belt.

The teeth on the belt will prevent slipping and hence loss of rpms.

- Unordered List ItemThe advantage of a non tensioned belt is also that the spindle motor bearings are not put under sideways pressure.

**Continue to Configuring the pc ethernet port.**
**Continue to the table of contents.**
