

# Menukeuze "Tekst Mengen Wizard"

## Purpose

The purpose of the **Text Merge** feature is to insert lines of text coming from an exterior source without having to retype it within Symmetry. This source could be any text document in another

el, or an e-mail message. The text itself can be very heterogeneous a list of names, technical date used on typeshields, elaborate texts on works of art or historical buildings and so on and so forth. As the name of the function indicates, this function will be only copying the text itself, not its characteristics.

Basically, what this option allows you to do is to create a single plate or Multiplate layout in Symmetry, specify font and line characteristics to each individual line, just like with any other job, and then import the texts coming from an external source.

For clarity's sake: what you *cannot* do with this function, is create an entire layout with several fonts, font sizes and characteristics and simply copy or merge this into a Symmetry job.

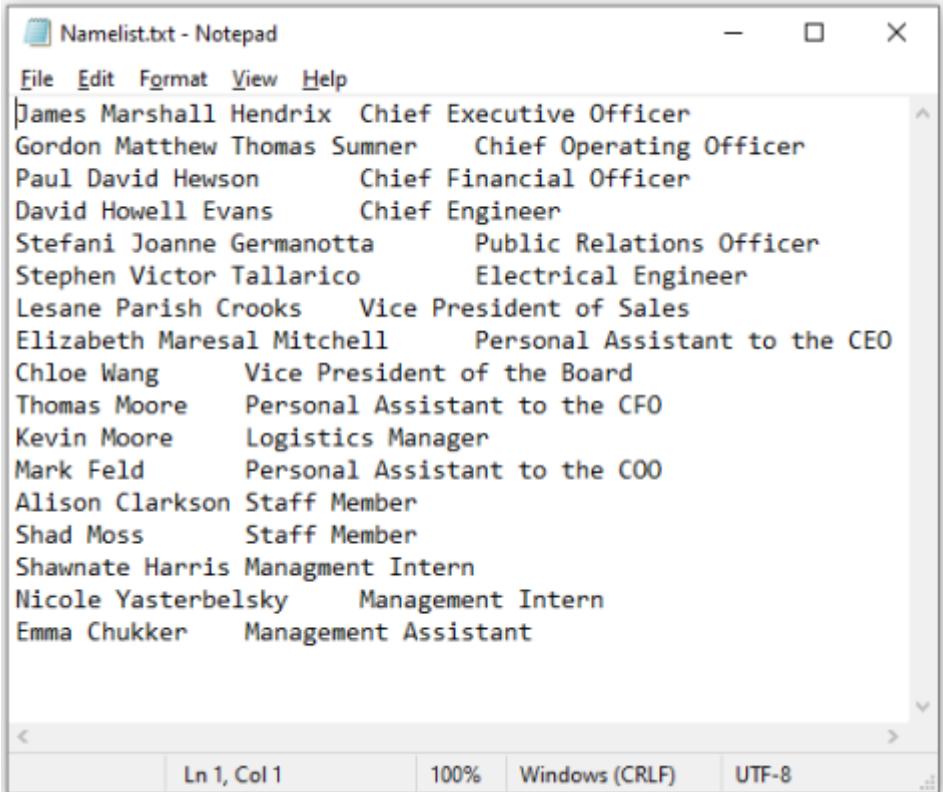

## External files

The pivotal concept in the **Text Merge Wizard** is *text*. Whether the text data you will import from MS Word, Excel or an e-mail message, you will need to strip the texts from all their layout characteristics

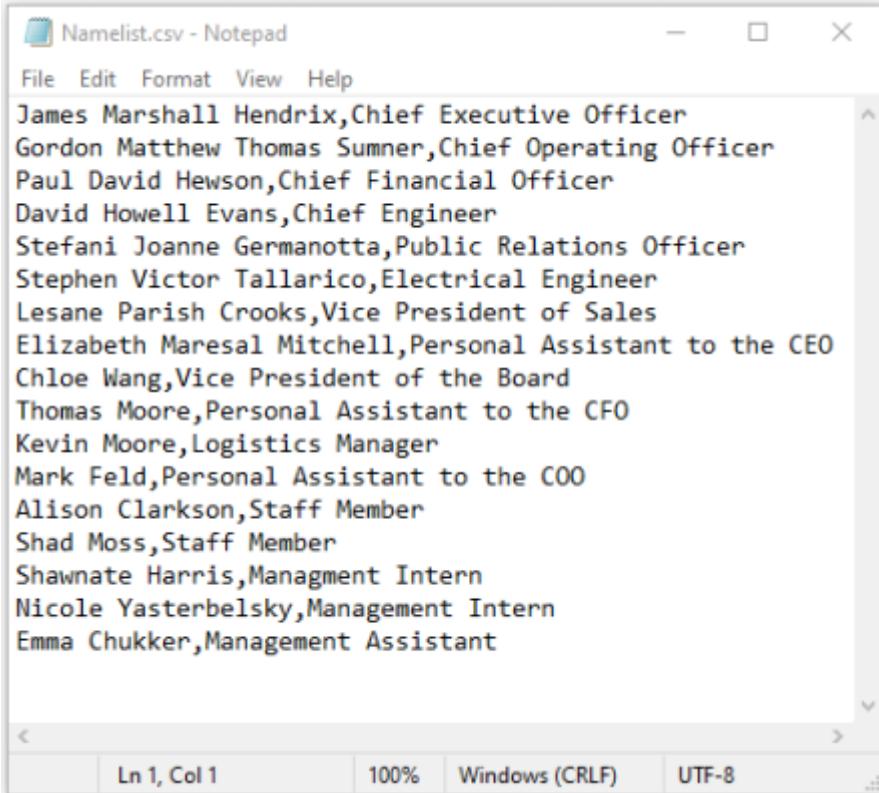

and deliver a file which contains text only. There are several ways to create a text file.

- From **Microsoft Word**, you can save a Word document as a text file through the “Save as” option and choose the desired file format in the “Options” menu. The most obvious option is **\*.txt** (“Text without attributes”).
- From **Microsoft Excel**, you can save an Excel sheet going through the same method. One option here is to save the file as a **\*.txt** file. However, another text file format is **\*.csv**.

The difference between the two is pretty obvious and can easily be discovered by saving the same Excel file as a txt and as a csv, and comparing the result in your notepad. In the txt file, the text in two adjacent columns are separated by a wide blank “space”, which is created by a tab stop. In the csv file, you will see that the texts – or “values” since these texts could as well be numbers – coming from the cells in your Excel file are separated by commas. Hence the name “csv”, which stand for “comma separated values”.

```
James Marshall Hendrix Chief Executive Officer
Gordon Matthew Thomas Sumner Chief Operating Officer
Paul David Hewson Chief Financial Officer
David Howell Evans Chief Engineer
Stefani Joanne Germanotta Public Relations Officer
Stephen Victor Tallarico Electrical Engineer
Lesane Parish Crooks Vice President of Sales
Elizabeth Maresal Mitchell Personal Assistant to the CEO
Chloe Wang Vice President of the Board
Thomas Moore Personal Assistant to the CFO
Kevin Moore Logistics Manager
Mark Feld Personal Assistant to the COO
Alison Clarkson Staff Member
Shad Moss Staff Member
Shawnate Harris Management Intern
Nicole Yasterbelsky Management Intern
Emma Chukker Management Assistant
```

The screenshot shows a Notepad window with the title 'Namelist.csv - Notepad'. The content of the window is a list of names and titles, each separated by a comma. The list includes:

- James Marshall Hendrix, Chief Executive Officer
- Gordon Matthew Thomas Sumner, Chief Operating Officer
- Paul David Hewson, Chief Financial Officer
- David Howell Evans, Chief Engineer
- Stefani Joanne Germanotta, Public Relations Officer
- Stephen Victor Tallarico, Electrical Engineer
- Lesane Parish Crooks, Vice President of Sales
- Elizabeth Maresal Mitchell, Personal Assistant to the CEO
- Chloe Wang, Vice President of the Board
- Thomas Moore, Personal Assistant to the CFO
- Kevin Moore, Logistics Manager
- Mark Feld, Personal Assistant to the COO
- Alison Clarkson, Staff Member
- Shad Moss, Staff Member
- Shawnate Harris, Management Intern
- Nicole Yasterbelsky, Management Intern
- Emma Chukker, Management Assistant

The Notepad window has a standard Windows interface with a menu bar (File, Edit, Format, View, Help), a toolbar, and status bar at the bottom. The status bar shows 'Ln 1, Col 1', '100%', 'Windows (CRLF)', and 'UTF-8'.

These commas will appear very useful to arrange the data through Symmetry's text merge procedure. However, since you are going to merge this text into an existing, premade Symmetry layout, you will need to make sure the number of text lines within your Symmetry layout corresponds with the number of lines from your source file.

## The "Variable Text Merge" window

### ■ Step 1: Select a file

Click "Browse" and select the text file or CSV (comma delimited file) you want to import.

Click 'Browse' and select the text file or CSV (comma delimited file) you want to import

- When you click on the "Browse" button, an explorer window will open and you can browse through the folders and files on your computer to retrieve the text file you will want to merge into your Symmetry layout.

### ■ Step 2: Structuring the data

The data in your file uses characters such as commas or tabs to separate each field. Choose from the

The data in your file uses characters such as commas or tabs to separate each field, choose from the series of characters below that best describes your data.

You can see how your text is affected in the preview below:

- New Line (one entry per line)**
- Comma ( , )**
- Semicolon ( ; )**
- Pipe( \| )**
- Space**

James Marshall Hendrix	Chief Executive Officer
Gordon Matthew Thomas Sumner	Chief Operating Officer
Paul David Hewson	Chief Financial Officer

haracters below that best describes your data.

You can see how your text is affected in the preview below.

- **New Line (one entry per line):**

Each line of text in your original file will correspond with a line of text in your Symmetry engraving job.

e.g. A list of names in an e-mail can easily be copied and pasted into a blank Notepad screen, saved as a txt file and merged into a Symmetry job.

- **Comma\\:** The obvious choice if your original file is a CSV (“comma-separated” value) file.
- **Semicolon**
- **Pipe” ( \| )**
- **Space**
