"Condense Mode" menu option

Details

Three options are available:

- **Lines individually**: Allows the operator to set a condensation factor for each text line individually.
- **Equal Height Lines**: When the condensation for a specific text line is set (either manually or because the text in that specific line would otherwise become too long), all other text lines with the exact same height automatically receive the same condensation factor.
- **All Lines Equally**: The smallest percentage of any one text line is applied to all other text lines in the job, no matter their height.

The **Condensation** is expressed as a percentage of the standard text width, which corresponds to 100%. As a consequence, the stronger a text is condensed, the smaller the percentage will become. A 50% condensed text line will be shorter than a 90% text line.

Available through

- Menu **Plate** - option **Condense mode**
